

# CISC 3115 EWQ6

# Set

Hui Chen

Department of Computer & Information Science

CUNY Brooklyn College

# Module Outline

- Discussed
  - Concept of data structure
  - Use data structures
    - List
      - Sorting and searching in lists and arrays
  - Stack
  - Queue and priority queue
- To discuss
  - Set and map

# Outline of This Lecture

- Concept of the Set data structure
- Set in Java
- HashSet, LinkedHashSet, and TreeSet
- Compare performance of Set and List
- Example programs
  - Word counting

# Motivation

- In many applications, we do not allow duplications in a collection
  - Students enrolled in a class.
    - The class cannot have more than one objects of the same student.
  - Passengers on board an airplane
    - The passengers must also be unique.
- However, if we
  - `ArrayList<Student> studentList = new ArrayList<>();`
- We can do,
  - `studentList.add(new Student(1, "John"));`
  - `studentList.add(new Student(1, "John"));`
- Can we design a data structure that prevents this type of error?

# Set

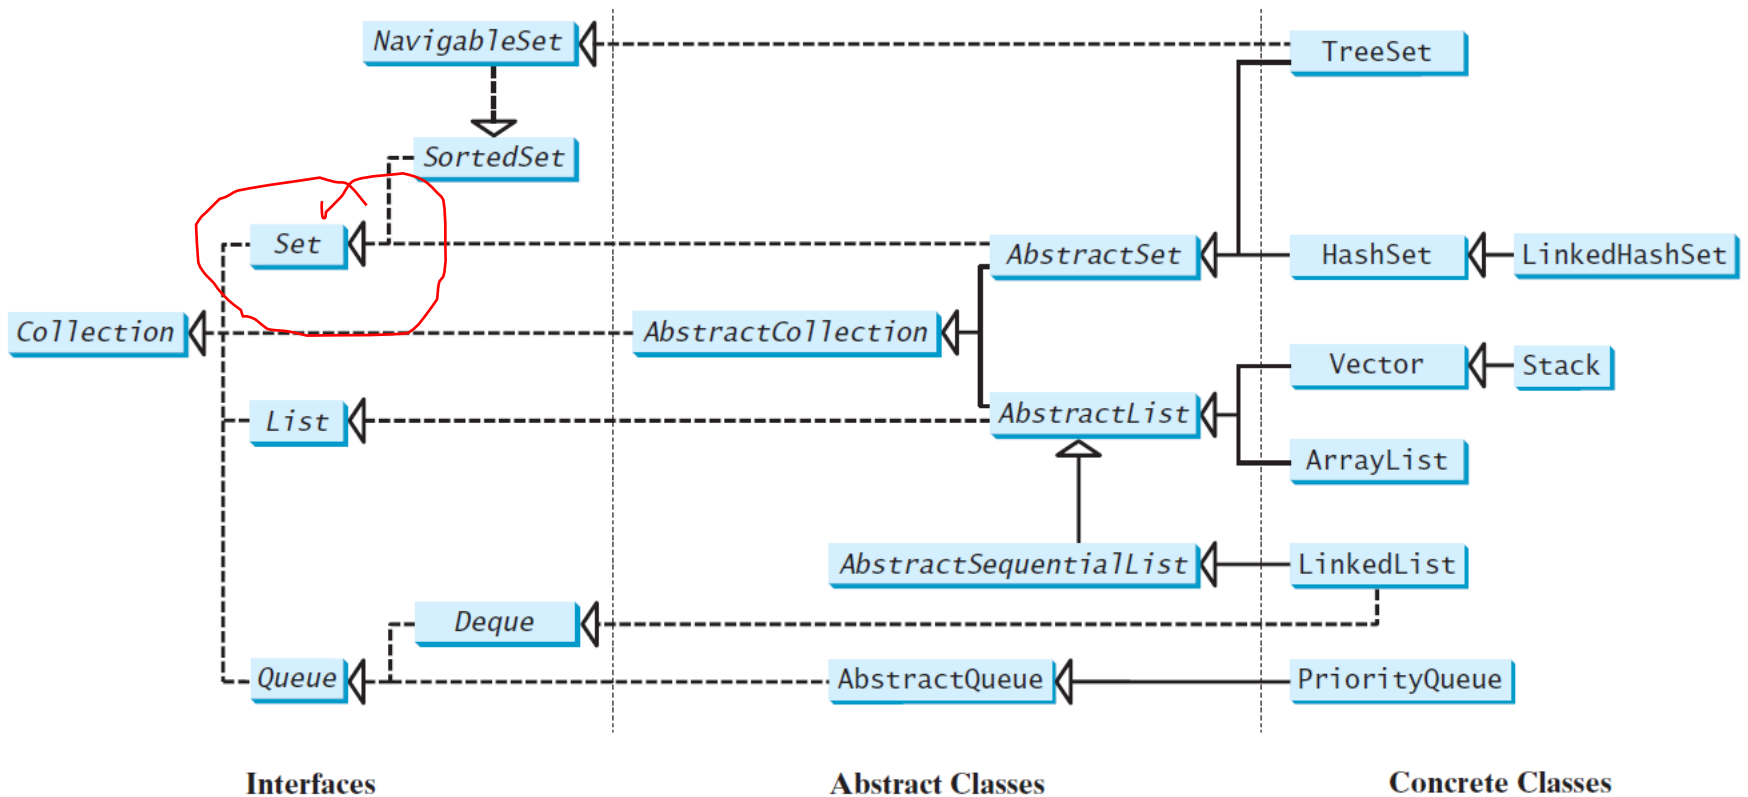

- A collection data structure where every item must be unique (no duplicates)

# The Set Interface

- The Set interface extends the Collection interface.
- It does not introduce new methods or constants, but it stipulates that an instance of Set contains no duplicate elements.
- The concrete classes that implement Set must ensure that no duplicate elements can be added to the set.
- Meaning of duplicates or uniqueness
  - No two elements  $e_1$  and  $e_2$  can be in the set such that  $e_1.equals(e_2)$  is true

# Review: Java Collection Framework Type Hierarchy

- Set is a subinterface of Collection

«interface»  
*java.lang.Iterable<E>*

+*iterator(): Iterator<E>*

Returns an iterator for the elements in this collection.

«interface»  
*java.util.Collection<E>*

+*add(o: E): boolean*  
+*addAll(c: Collection<? extends E>): boolean*  
+*clear(): void*  
+*contains(o: Object): boolean*  
+*containsAll(c: Collection<?>): boolean*  
+*equals(o: Object): boolean*  
+*hashCode(): int*  
+*isEmpty(): boolean*  
+*remove(o: Object): boolean*  
+*removeAll(c: Collection<?>): boolean*  
+*retainAll(c: Collection<?>): boolean*  
+*size(): int*  
+*toArray(): Object[]*

Adds a new element *o* to this collection.  
Adds all the elements in the collection *c* to this collection.  
Removes all the elements from this collection.  
Returns true if this collection contains the element *o*.  
Returns true if this collection contains all the elements in *c*.  
Returns true if this collection is equal to another collection *o*.  
Returns the hash code for this collection.  
Returns true if this collection contains no elements.  
Removes the element *o* from this collection.  
Removes all the elements in *c* from this collection.  
Retains the elements that are both in *c* and in this collection.  
Returns the number of elements in this collection.  
Returns an array of *Object* for the elements in this collection.

«interface»  
*java.util.Iterator<E>*

+*hasNext(): boolean*  
+*next(): E*  
+*remove(): void*

Returns true if this iterator has more elements to traverse.  
Returns the next element from this iterator.  
Removes the last element obtained using the next method.

# Set and Its Subtypes

# Set and Its Subtypes

# AbstractSet

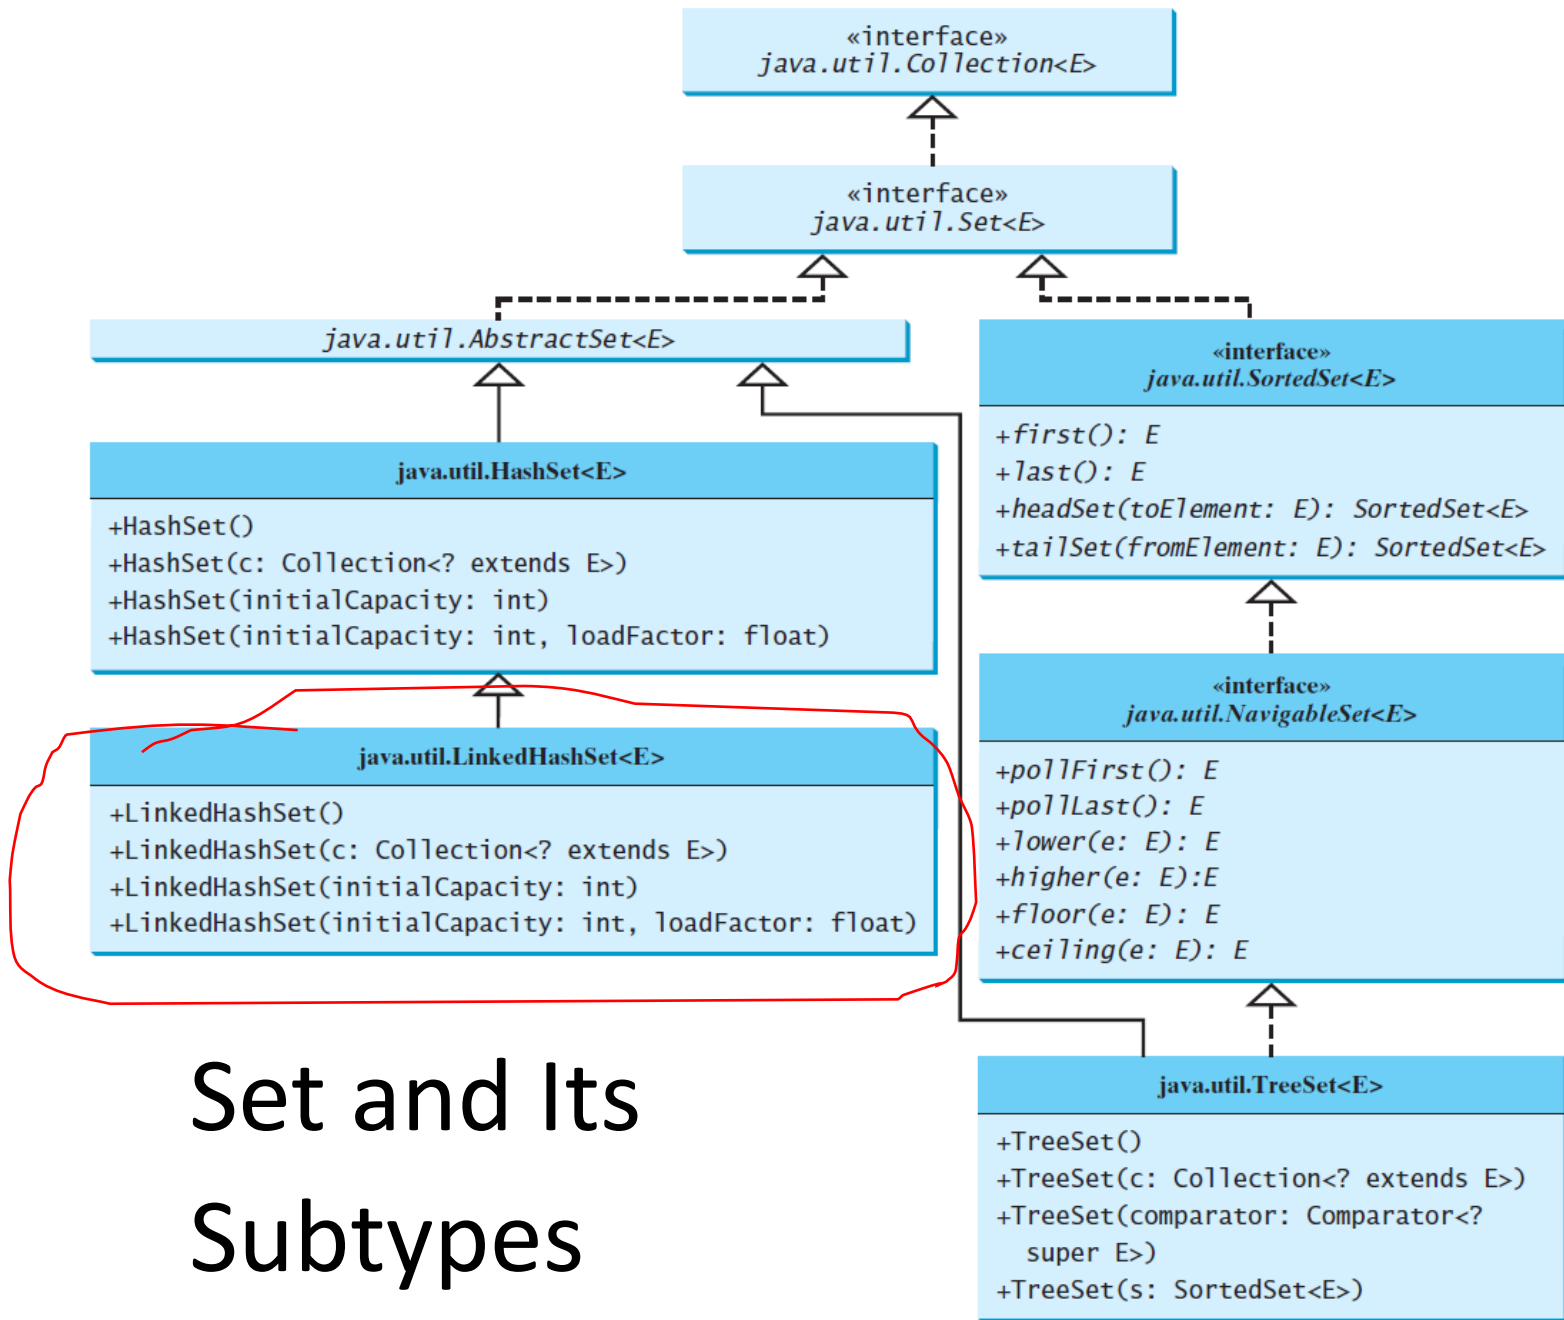

- The AbstractSet class is a convenience class that extends AbstractCollection and implements Set.
- The AbstractSet class provides concrete implementations for the equals method and the hashCode method.
  - You may use it to determine if two sets are equal
  - The hash code of a set is the sum of the hash code of all the elements in the set.
- Since the size method and iterator method are not implemented in the AbstractSet class, AbstractSet is an abstract class

# Set and Its Subtypes

# HashSet

- The HashSet class is a concrete class that implements Set.
- It can be used to store duplicate-free elements.
- For efficiency, objects added to a hash set need to implement the hashCode method in a manner that properly disperses the hash code
  - Recall the contract of the hashCode, and how the equals method should be overridden.

# Set and Its Subtypes

# LinkedHashSet

- LinkedHashSet retains the order of elements as they are inserted (insertion order) via a linked list
  - Note that insertion order is not affected if an element is re-inserted into the set.
  - Meaning of re-insertion
    - `if (set.contains(element)) { set.add(element); }`
- However, in a HashSet, the order of elements are unspecified and generally chaotic.

# HashSet: Example

- This example creates a hash set filled with strings, and traverse the elements in the list.
  - Use the enhanced for loop
  - Use the `Iterable::forEach` method and the `Consumer` interface
- Note: pay attention to the order of the elements

# LinkedHashSet: Example

- This example creates a linked hash set filled with strings, and traverse the elements in the list.
  - Use the enhanced for loop
  - Use the `Iterable::forEach` method and the `Consumer` interface
- Note: pay attention to the order of the elements

# Questions?

- Concept of set
- Set in Java
- HashSet and LinkedHashSet, and difference?

# Set and Its Subtypes

# SortedSet and TreeSet

- SortedSet is a subinterface of Set, which guarantees that the elements in the set are sorted.
- TreeSet is a concrete class that implements the SortedSet interface.
  - You can use an iterator to traverse the elements in the sorted order.

# Sorting in TreeSet

- The elements can be sorted in two ways
  - One way is to use the Comparable interface, which means elements (objects) needs to be comparable.
  - The other way is to specify a comparator for the elements, i.e., *order by comparator*.
    - if the class for the elements does not implement the Comparable interface, or
    - you don't want to use the compareTo method in the class that implements the Comparable interface

# TreeSet: Example 1

- This example creates a hash set filled with strings, and then creates a tree set for the same strings.
  - The strings are sorted in the tree set using the `compareTo` method in the `Comparable` interface.

# TreeSet: Example 2

- The example also creates a tree set of geometric objects.
  - The geometric objects are sorted using the compare method in the Comparator interface

# Questions?

- SortedSet and TreeSet
- Based on what are SortedSet and TreeSet sorted?

# List and Set

- Compare List and Set
- How much time does it take to do the following?
  - Test if the collection contains an element
  - Remove a given element
- See the example

# Set: Example

- Write an application that counts the number of the keywords in a Java source file

# Questions?

- Count keywords using Set
