# Software Design

- ▶ Design starts mostly from/with requirements – evolving mostly from functionalities and other non-functional characteristics
  - ▶ In the waterfall model Design generally occurs after Requirements
  - ▶ In agile, design is performed during in each iteration
- ▶ To answer: How is the software solution going to be structured?
  - ▶ What are the main components – (functional composition) often directly from requirements' functionalities (e.g., use cases, user stories, scenarios)
  - ▶ How are these components related? – Possibly re-organize the components (composition/decomposition)
- ▶ Two main levels of design:
  - ▶ Architectural (high level) design
  - ▶ Detailed design
  - ▶ Different design concerns at different abstraction levels (e.g. classes vs. modules vs. entire system)
- ▶ How should we depict design – what notation/language?

# Review: High-level and Low-level Designs

Architectural design (high-level design) patterns and styles

- ▶ MVC, Layered, Pipeline, Client-Server, SOA, ...

Detailed design (low-level design)

- ▶ Functional decomposition, database design, Object-Oriented design, user-interface design, ...
- ▶ Object-Oriented Design and UML – focused on modeling
- ▶ To discuss more about Object-Oriented design

- ▶ the Review Comparator interface
- ▶ the Strategy Design Pattern

# Java Interface Revisited

Let's consider Java interface Comparator

- ▶ How is it defined?
- ▶ How can it be used?

# The Comparator Interface

Let's consider Java interface Comparator

► How is it defined?

```
1 interface Comparator<T> {  
2     int compare(T obj1, T obj2)  
3 }
```

► How can it be used?

```
1 sort(List<T> list, Comparator<? super T> c)
```

# The Comparator Interface

Let's consider Java interface Comparator

- ▶ How is it defined?

```
1 interface Comparator<T> {  
2     int compare(T obj1, T obj2)  
3 }
```

- ▶ *“Compares its two arguments for order. Returns a negative integer, zero, or a positive integer as the first argument is less than, equal to, or greater than the second.”*
- ▶ How can it be used?

```
1 sort(List<T> list, Comparator<? super T> c)
```

Sorting often requires a comparator specific for a type – e.g. sorting instances of type Card, requires a Comparator for playing cards

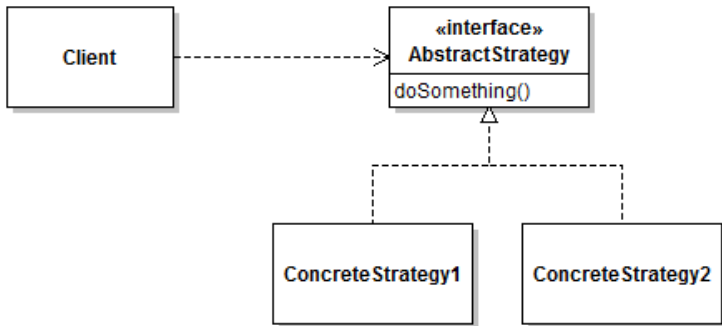

# How is it designed?

How does the design come to be?

Comparator epitomizes a design pattern, called the Strategy design pattern.

# The Strategy Design Pattern

“Define a family of algorithms, encapsulate each one, and make them interchangeable. Strategy lets the algorithms vary independently of clients that use it.” – from the *Gang of Four Book*

# The Strategy Design Pattern: Example

Consider that we need to sort a deck of cards

Let's discuss,

1. Does this design have Extensibility?
2. Does this design have Loose Coupling?

# Outline

# Recap: Violations of Class Design Guidelines

```

1 public class Deck
2 {
3     // violates 1. public -> no door to guide the data field
4     public Stack<Card> aCards = new Stack<>();
5
6     // violates 4. return reference to a class variable -> front door
       is open
7     public Stack<Card> getCards()
8     { return aCards; }
9
10    /* violates 2 and 3. set a reference to a class variable; but
       caller
11       keeps a reference -- back door open because caller has a
       reference
12       to containing object */
13    public void setStack(Stack<Card> pCards)
14    { aCards = pCards; }
15
16    /* violates 3. set a reference to a class variable; but caller
       keeps a reference -- back door open because caller has a
       reference
17       to containing object */
18    public void applyAll( List<Stack<Card>> pTaskList )
19    { pTaskList.add(aCards); }
20 }
21

```

Perhaps, the Deck class was ill-conceptualized ... what we really want to iterate over the deck of cards, then ...

# The Iterator Design Pattern

“Provide a way to access the elements of an aggregate object sequentially without exposing its underlying representation” – from the *Gang of Four* book

# The Iterator Design Pattern: Example

With this design, we do not expose its underlying representation of the “state”.

# Summary and Questions?

- ▶ The Strategy design pattern
- ▶ The Iterator design pattern
- ▶ Questions?
